

MATERIAL STORAGE AND MAINTENANCE.

It is recommended that for optimal service life, our PVC and rubber goods should be stored in the following manner:

- Laid flat or rolled to prevent long term creasing of the material where possible.
- Stored at room temperature out of direct sunlight.
- Regularly inspected for defects, cleaned and kept free of debris.

Please note the method of transport may not reflect the above recommendations.

Our Polywater Cleaning Agent is recommended for cleaning purposes.

(Please consult the product labelling for instructions of use. Data sheet available on request. Any item cleaned with Polywater, should be rinsed with water prior to use.)

In general, materials should be kept clear of oil based products and hydrocarbon derivatives.

It is especially important that any Magnetic or Velcro products be kept clean and free of debris.

Relevant standards and industry guidelines should be followed for any re-testing purposes.

For further material and handling information refer to our downloads section at:
